

Pocket Smart AI – Validate Gemini API Connectivity

Member Assignment: K. Jasiya

Team Leader: Sabana Fathima

1. Topic

Validate Gemini API connectivity

Epic: Epic 1: Gemini AI initialization

2. Project Overview

Pocket Smart AI is an AI-powered application built with FastAPI that uses Google Gemini AI. Before building any feature on top of it, the connection to the Gemini API must be confirmed to be working.

3. Objective

To check that the Gemini API key is valid and that the application can send a request to Gemini AI and receive a correct response.

4. Work Steps

- 1 Make sure the Gemini API key is stored in the GEMINI_API_KEY environment variable.
- 2 Install the Google Gemini Python package and load the key in a small test script.
- 3 Send a simple test prompt, such as "Hello", to the Gemini model.
- 4 Check that a valid response text is returned.
- 5 Test the error cases: a missing key, a wrong key, and no internet connection.
- 6 Confirm that clear error messages are shown when a request fails.
- 7 Report the test result to the team lead.

5. Main Parts of the Validation

- bullet API key loading from the environment

- bullet Test script with a simple prompt

- bullet Response check

- bullet Error case testing

- bullet Test result report

6. Expected Outcome

A confirmed working connection to the Gemini API, where a test request returns a valid response and errors are handled clearly, so the team can safely build the app features on it.
